TITLE

DIRECT BACKLIGHT MODULE

BACKGROUND OF THE INVENTION

5 **Field of the Invention**

The present invention relates to a direct backlight module, and in particular to a direct backlight module supporting the diffuser and illumination tubes simultaneously to overcome bending of the diffuser and illumination tubes due to thermal
10 expansion and contraction and insufficient rigidity thereof.

Description of the Related Art

Fig. 1 is a cross section showing a conventional direct backlight module 1. The conventional direct backlight module
15 1 includes a diffuser 11, a reflecting plate 12, a prism 17, a diffusing plate 18, two supports 13 and a plurality of illumination tubes 14. The reflecting plate 12 is disposed under the diffuser 11. The prism 17 is disposed on the diffuser 11. The diffusing plate 18 is disposed on the prism 17. The supports
20 13 are disposed on the reflecting plate 12 and located between the diffuser 11 and the reflecting plate 12. The plural illumination tubes 14 are disposed between the diffuser 11 and the reflecting plate 12.

As shown in Fig. 1, in order to protect the diffuser 11 from
25 bending, the supports 13 are disposed between the diffuser 11 and the reflecting plate 12 to support the diffuser 11. Thus, the optical character of the direct backlight module 1 is not deteriorated and even the illumination tubes 14 are not damaged by the bent diffuser 11. Nevertheless, when the size of the LCD
30 panel 15 increases, the illumination tube 14 also becomes

larger. Thus, the illumination tube 14 is bent and deformed due to its weight, deteriorating the optical character of the direct backlight module 1.

Fig. 2 is a cross section showing another conventional direct backlight module 2. In order to overcome the
5 aforementioned deformation of the illumination tubes 14 of the direct backlight module 1, a support 23 is disposed under the illumination tube 22 of the direct backlight module 2. Nevertheless, as shown in Fig. 2, when the size of the LCD panel
10 (not shown) increases, the diffuser 21 also becomes large. Thus, the diffuser 21 is bent and deformed, deteriorating the optical character of the direct backlight module 2.

Consequently, the invention provides a direct backlight module supporting the diffuser and the illumination tubes
15 simultaneously. The diffuser and illumination tubes are not bent and deformed due to insufficient rigidity thereof even when the LCD panel or the diffuser is large. Further, the diffuser and the illumination tubes are not deformed due to thermal expansion and contraction even when the direct backlight module
20 works for a long period of time. Thus, the optical character of the direct backlight module is not deteriorated.

SUMMARY OF THE INVENTION

An object of the invention is to provide a direct backlight
25 module. The direct backlight module comprises a diffuser; a reflecting plate disposed under the diffuser; an illumination tube disposed between the diffuser and the reflecting plate; and a support disposed on the reflecting plate and between the diffuser and the reflecting plate for supporting the diffuser
30 and the illumination tube simultaneously, wherein the support

has a fitting portion into which the illumination tube directly fits.

A detailed description will be given by the following embodiments with reference to the accompanying drawings.

5

BRIEF DESCRIPTION OF THE DRAWINGS

The present invention can be more fully understood by reading the subsequent detailed description and examples with references made to the accompanying drawings, wherein:

10 Fig. 1 is a cross section showing a conventional direct backlight module;

Fig. 2 is a cross section showing another conventional direct backlight module;

15 Fig. 3 is a cross section showing the direct backlight module of the invention;

Fig. 4 is a schematic view showing the supports disposed in the direct backlight module of the invention;

Fig. 5A, Fig. 5B, Fig. 5C, Fig. 5D, Fig. 5E, Fig. 5F and Fig. 5G show the configurations of the present supports.

20

DETAILED DESCRIPTION OF THE INVENTION

Referring to Fig. 3 and Fig. 4, the direct backlight module 100 comprises a diffuser 110, a reflecting plate 120, an illumination tube 130, a support 140, a first diffusing plate 150, a prism 160 and a second diffusing plate 170.

25 The first diffusing plate 150, the prism 160 and the second diffusing plate 170 can be added or omitted as required. In addition, the arrangement of the first diffusing plate 150, the prism 160 and the second diffusing plate 170 can be changed as required. In this embodiment, the first diffusing plate 150 is

30

disposed on the diffuser 110. The prism 160 is disposed on the first diffusing plate 150. The second diffusing plate 170 is disposed on the prism 160. The reflecting plate 120 is disposed under the diffuser 110 and the illumination tube 130. The illumination tube 130 is disposed between the diffuser 110 and the reflecting plate 120. The support 140 is disposed on the reflecting plate 120 and between the diffuser 110 and the reflecting plate 120.

As shown in Fig. 3 and Fig. 4, the support 140 supports the diffuser 110 and the illumination tube 130 simultaneously. Additionally, the support 140 has a fitting portion 142 into which the illumination tube 130 directly fits. Thus, the illumination tube 130 is supported by the support 140.

Specifically, a first minor gap G1 exists between the support 140 and the diffuser 110 to protect the diffuser 110 from deformation due to thermal expansion and contraction of the support 140. Nevertheless, the diffuser 110 is in direct contact with the support 140 and supported thereby under normal conditions.

Similarly, a second minor gap G2 exists between the fitting portion 142 of the support 140 and the illumination tube 130 to protect the illumination tube 130 from deformation due to thermal expansion and contraction of the support 140.

In this embodiment, the support 140 is disposed on the reflecting plate 120 and has a rectangular shape. The height of the support 140 is substantially equal to the distance between the diffuser 110 and the reflecting plate 120. The support 140 supports the diffuser 110. Further, the first minor gap G1 between the support 140 and the diffuser 110 protects the diffuser 110 from deformation due to thermal expansion and

contraction of the support 140. In addition, the fitting portion 142 is a circular hole for accommodating the illumination tube 130. The diameter of the fitting portion 142 is substantially equal to that of the illumination tube 130. Further, the second
5 minor gap G2 between the fitting portion 142 of the support 140 and the illumination tube 130 protects the illumination tube 130 from deformation due to thermal expansion and contraction of the support 140.

Additionally, the reflecting plate 120 has a groove 122 and
10 the support 140 has an engaging portion 144 formed thereunder, as shown in Fig. 4. The support 140 is fixed onto the reflecting plate 120 by inserting the engaging portion 144 into the groove 122. Then, the engaging portion 144 is securely fixed in the groove 122 by hot glue.

15 The support 140, the fitting portion 142 and the engaging portion 144 of the invention can have many configurations, and the shape of the groove 122 of the reflecting plate 120 can be changed according to the shape of the engaging portion 144 of the support 140, as shown in Fig. 5A, Fig. 5B, Fig. 5C, Fig. 5D,
20 Fig. 5E, Fig. 5F and Fig. 5G.

Moreover, the support 140 is made of a material of light weight and high intensity. For example, the support 140 may be made of plastic such as acrylic. Thus, the total weight of the direct backlight module 100 is not significantly increased.

25 While the invention has been described by way of example and in terms of the preferred embodiment, it is to be understood that the invention is not limited to the disclosed embodiments. To the contrary, it is intended to cover various modifications and similar arrangements (as would be apparent to those skilled in
30 the art). Therefore, the scope of the appended claims should

be accorded the broadest interpretation so as to encompass all
such modifications and similar arrangements.
